General Pharmacology

The general pharmacology section covers the basic principles of pharmacology, including drug classification, pharmacokinetics, and pharmacodynamics. Drug classification is the process of organizing drugs into groups based on their chemical structure, mechanism of action, or therapeutic use. Pharmacokinetics is the study of the absorption, distribution, metabolism, and excretion of drugs in the body.

Pharmacodynamics is the study of the effects of drugs on the body.

Drug Therapy

The drug therapy section provides information on the major drug classes used in nursing care, including antibiotics, analgesics, cardiovascular drugs, and psychiatric drugs. Each drug class is discussed in detail, including its mechanism of action, therapeutic uses, side effects, and nursing considerations. The drug therapy section also includes a chapter on drug interactions, which is important for nurses to be aware of in order to prevent adverse drug reactions.

Nursing Considerations

The nursing considerations section covers the nursing implications of drug therapy, including drug administration, monitoring, and patient education. Drug administration is the process of giving medications to patients. Nurses need to be familiar with the different routes of drug administration, as well as the proper storage and handling of medications. Monitoring is the process of observing patients for adverse drug reactions and other signs of toxicity. Patient education is the process of teaching patients about their medications, including how to take them, what side effects to watch for, and when to call the doctor or nurse.

Lehne Pharmacology for Nursing Care is a comprehensive guide to the pharmacology of nursing care. It provides students and nurses with the knowledge and skills they need to safely and effectively administer medications. The book is well-written and easy to understand, and it is an essential resource for nurses who want to provide the best possible care to their patients.
